

Hybrid Cloud Business Service Monitoring

True Business Context Redefines Monitoring Strategy

Skylar One (formerly SL1) helps businesses monitor what truly matters—the health of a business service—rather than the status of a bunch of devices. Contextual business service monitoring provides an easy way to know if IT is delivering on its promises to the business, while also giving deep visibility into the underlying infrastructure the business runs on.

Monitor Everything — Wherever it Is

Designed for the future of hybrid IT, Skylar One supports broad and deep observability into a large range of AWS, GCP, Azure and CSP services as well as traditional infrastructure and private cloud for full cloud native, multi-cloud and hybrid cloud monitoring. With no blind spots for errors to hide, IT teams can quickly spot issues and better map business service dependencies.

Future Proof Monitoring

Minimize the chance of monitoring gaps and easily meet business requests for new technology with Skylar One. Its no-code and low-code builders let you create monitoring for practically any asset. Only Skylar One is proven to deliver observability for assets ranging from satellites to oil rigs to livestock.

Update IT Asset Status Instantly

Ensure a consistent catalog of all IT assets and their compliance with CMDB synchronization. Skylar Automation (formerly Powerflow) automatically identifies and reconciles gaps in asset catalogs, so you always know the state of IT assets.

Reduce Ticket Volume and Noise

Prevent lost productivity that comes from having multiple teams chasing dozens of alerts for a single incident. Skylar One event correlation reduces alert overload by 80%+ so your team can focus on what matters most.

Speed Incident Response

When incidents happen, stop wasting time gathering diagnostic data from disparate tools. Skylar One automatically consolidates the most important information needed to start troubleshooting incidents. It also automates ITSM and notification workflows to create, populate and route tickets, and notify the right teams to jump-start remediation efforts.

Accelerate and Automate Root Cause Analysis

Skylar Automated AI automatically correlates events from your monitored environment and analyzes logs with machine learning to spot anomalies or changes that indicate likely root cause when events occur, so you can solve them faster and get business running again.

Enterprise Grade

Skylar One is a true, enterprise-grade offering that provides highly scalable, secure, multitenant deployments on-premises or in SaaS, allowing you ultimate flexibility based on your business' needs and data security requirements.
